

Frost Nip, Frostbite: This Medicine Works

Allow me to introduce you to one of my staff, Renee. She lives on a homestead in upstate Pennsylvania with her family. Her husband recently suffered what could have developed into a lifelong condition. She shares her story that might be helpful to others during the grueling winter temperatures this winter.

My Husband's Frostbite

While ideally, it would be lovely to sit by the fire when homesteading, the animals still need to be milked and fed, and wood needs hauling.

Recently, when we ran low on wood, a cold snap of below -10 degrees rolled in, requiring my husband to work extra hours hauling in firewood.

He should have stopped when his hands first showed signs of trouble, but tenacity set in. He ended up spending too long exposed to the elements.

It started with redness of his hands, followed by swollen fingers and stinging pain. His toes were also discolored and numb. That's when I knew I had to act quickly.

Armed with my homeopathy remedy kit and the knowledge I have attained from Joette, from not only working with her but scouring her blogs, I set to work to halt the progression.

I keyed in the search bar "frostbite," and the [blog on this condition](#) came up.

Joette discussed that frostbitten skin is best warmed by immersion in water, around 105°–110° F, until circulation, color and sensation return. Overly warm or hot water may burn the skin.

So that's where we started.

While his extremities were soaking, I headed to my homeopathy kits and followed Joette's directions.

[Hamamelis 200C](#) mixed with [Arnica 3](#) is the Banerji Protocol she discussed. I didn't have [Arnica](#) in that potency though, so instead, I used the next lowest I own, [Arnica montana 30X](#).

Joette teaches that repetition ought to be set at about

every 1-3 hours when the frostbite is more severe. Given the way his hands looked and his pain, I determined that every 1- 2 hours would be best.

After only a dose, the color returned, and he described the pain as better by about 30%. This took about an hour.

Over the next hour, the pain dwindled to about 10% of its original sensations, then overall by the end of the night. He took it again twice the next day, and that was that.

That second day, he said to me, "Thanks, Hon! Now back to work."

Given our cold region and the fact that so much of our lives revolve around being outside, it has strengthened my resolve to keep my remedies handy and my knowledge relevant.

Patch 'em up and send 'em back out.

Thanks, Drs. Banerji and Joette!
